bit.ly/let-eat-cake

Backward design

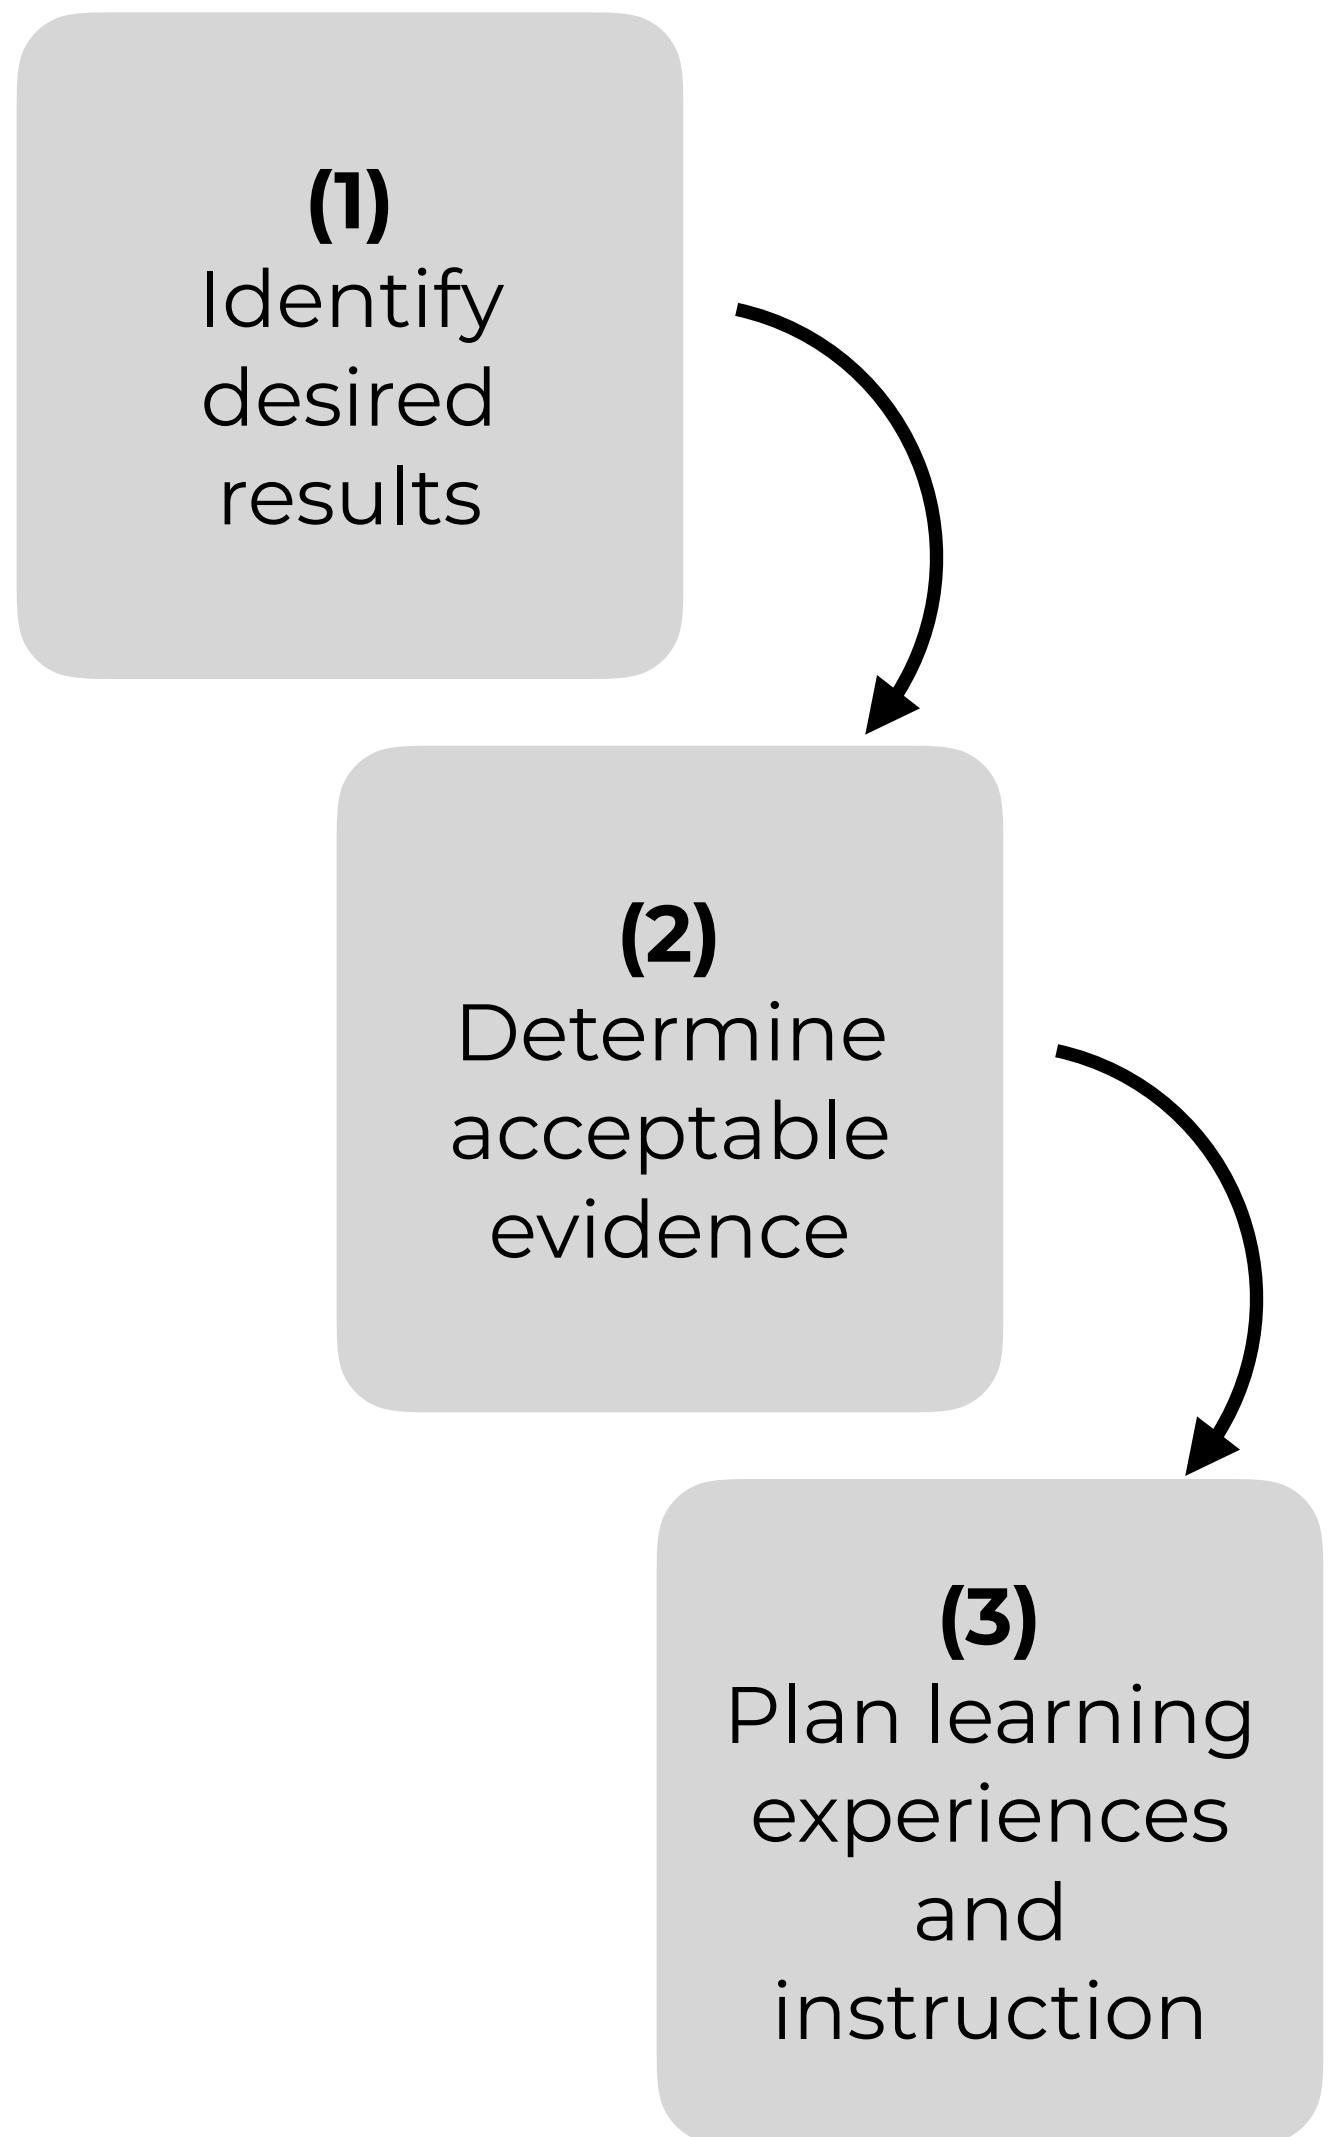

set goals for educational curriculum before choosing instructional methods + forms of assessment

analogous to travel planning - itinerary deliberately designed to meet cultural goals, not purposeless tour of all major sites in a foreign country

Wiggins, Grant P., Grant Wiggins, and Jay McTighe. *Understanding by design*. Ascd, 2005.

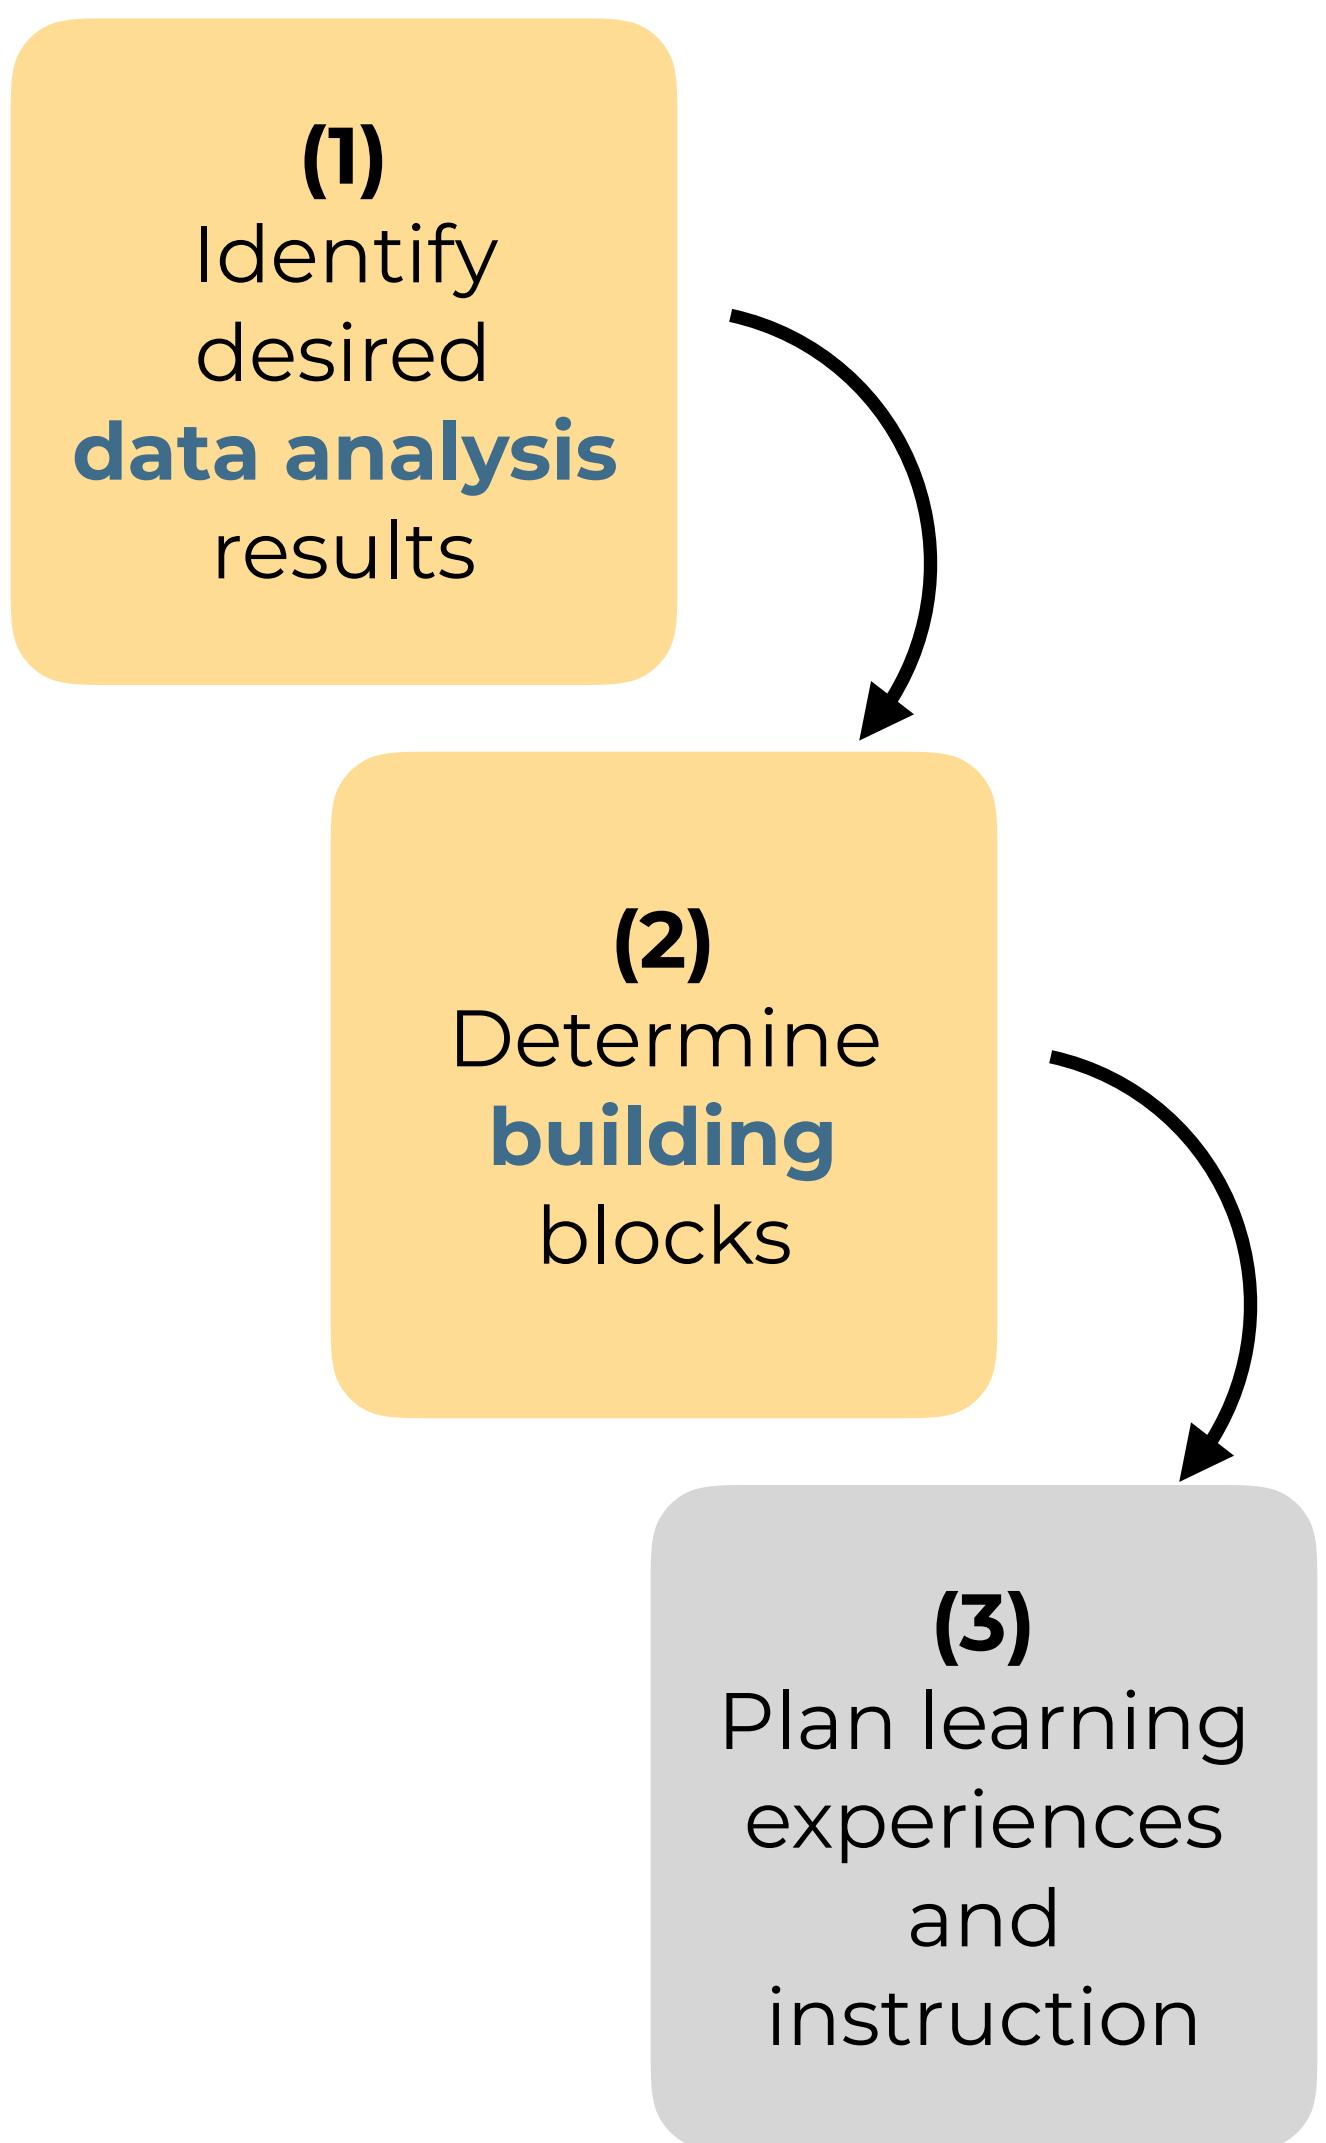

Designing backwards

students are first exposed to results and findings of a data analysis

and then learn the building blocks of the methods and techniques used along the way

Context

assumes
no
background

focuses on
EDA +
modeling &
inference +
modern
computing

requires
reproducibility

emphasizes
collaboration +
effective
communi-
cation

uses R as the
statistical
programming
language

Which of the following four descriptions gives you a **better sense** of the final product?

visualization

Which of the following two examples is more likely to be **interesting** for a wide range of students?

(a)

- ❑ Declare the following variables
- ❑ Then, determine the class of each variable

```
# Declare variables
```

```
x ← 8  
y ← "monkey"  
z ← FALSE
```

```
# Check class of x  
class(x)
```

```
#> [1] "numeric"
```

```
# Check class of y  
class(y)
```

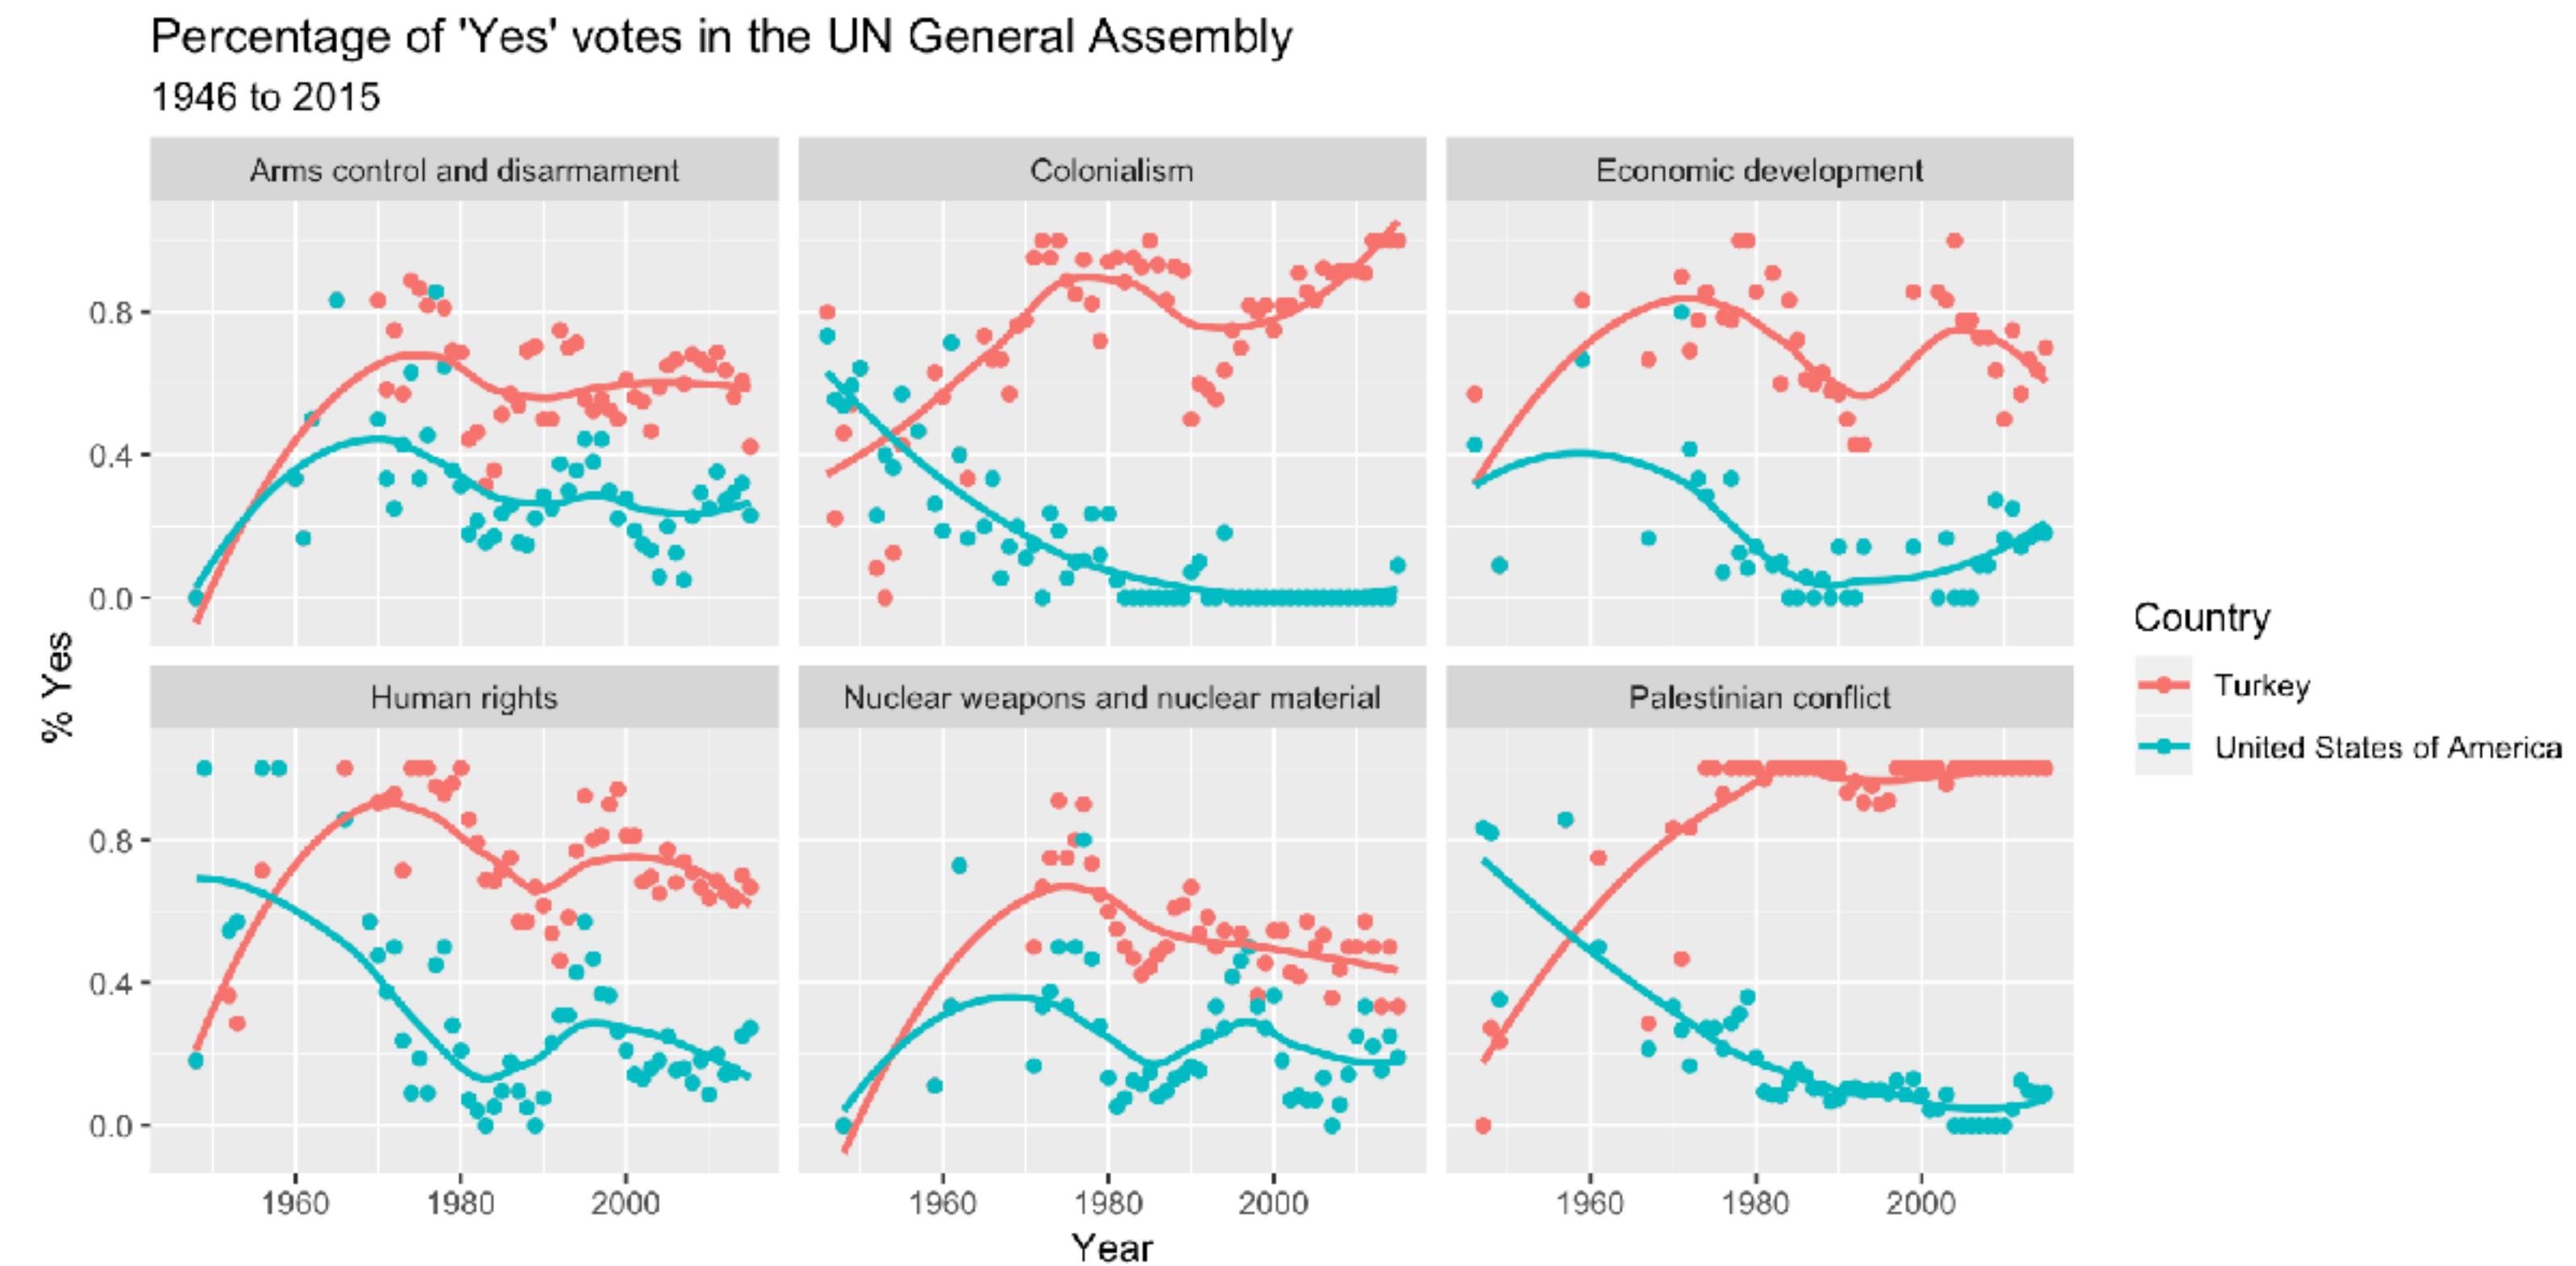

```
#> [1] "character"
```

```
# Check class of z  
class(z)
```

```
#> [1] "logical"
```

(b)

- ❑ Open today's demo project
- ❑ Knit the document and discuss the results with your neighbor
- ❑ Then, change **Turkey** to a different country, and plot again

with great examples,
comes a great amount of code...

but let's focus on the task at hand...

- Open today's demo project
- Knit the document and discuss the results with your neighbor
- Then, change Turkey to a different country, and plot again

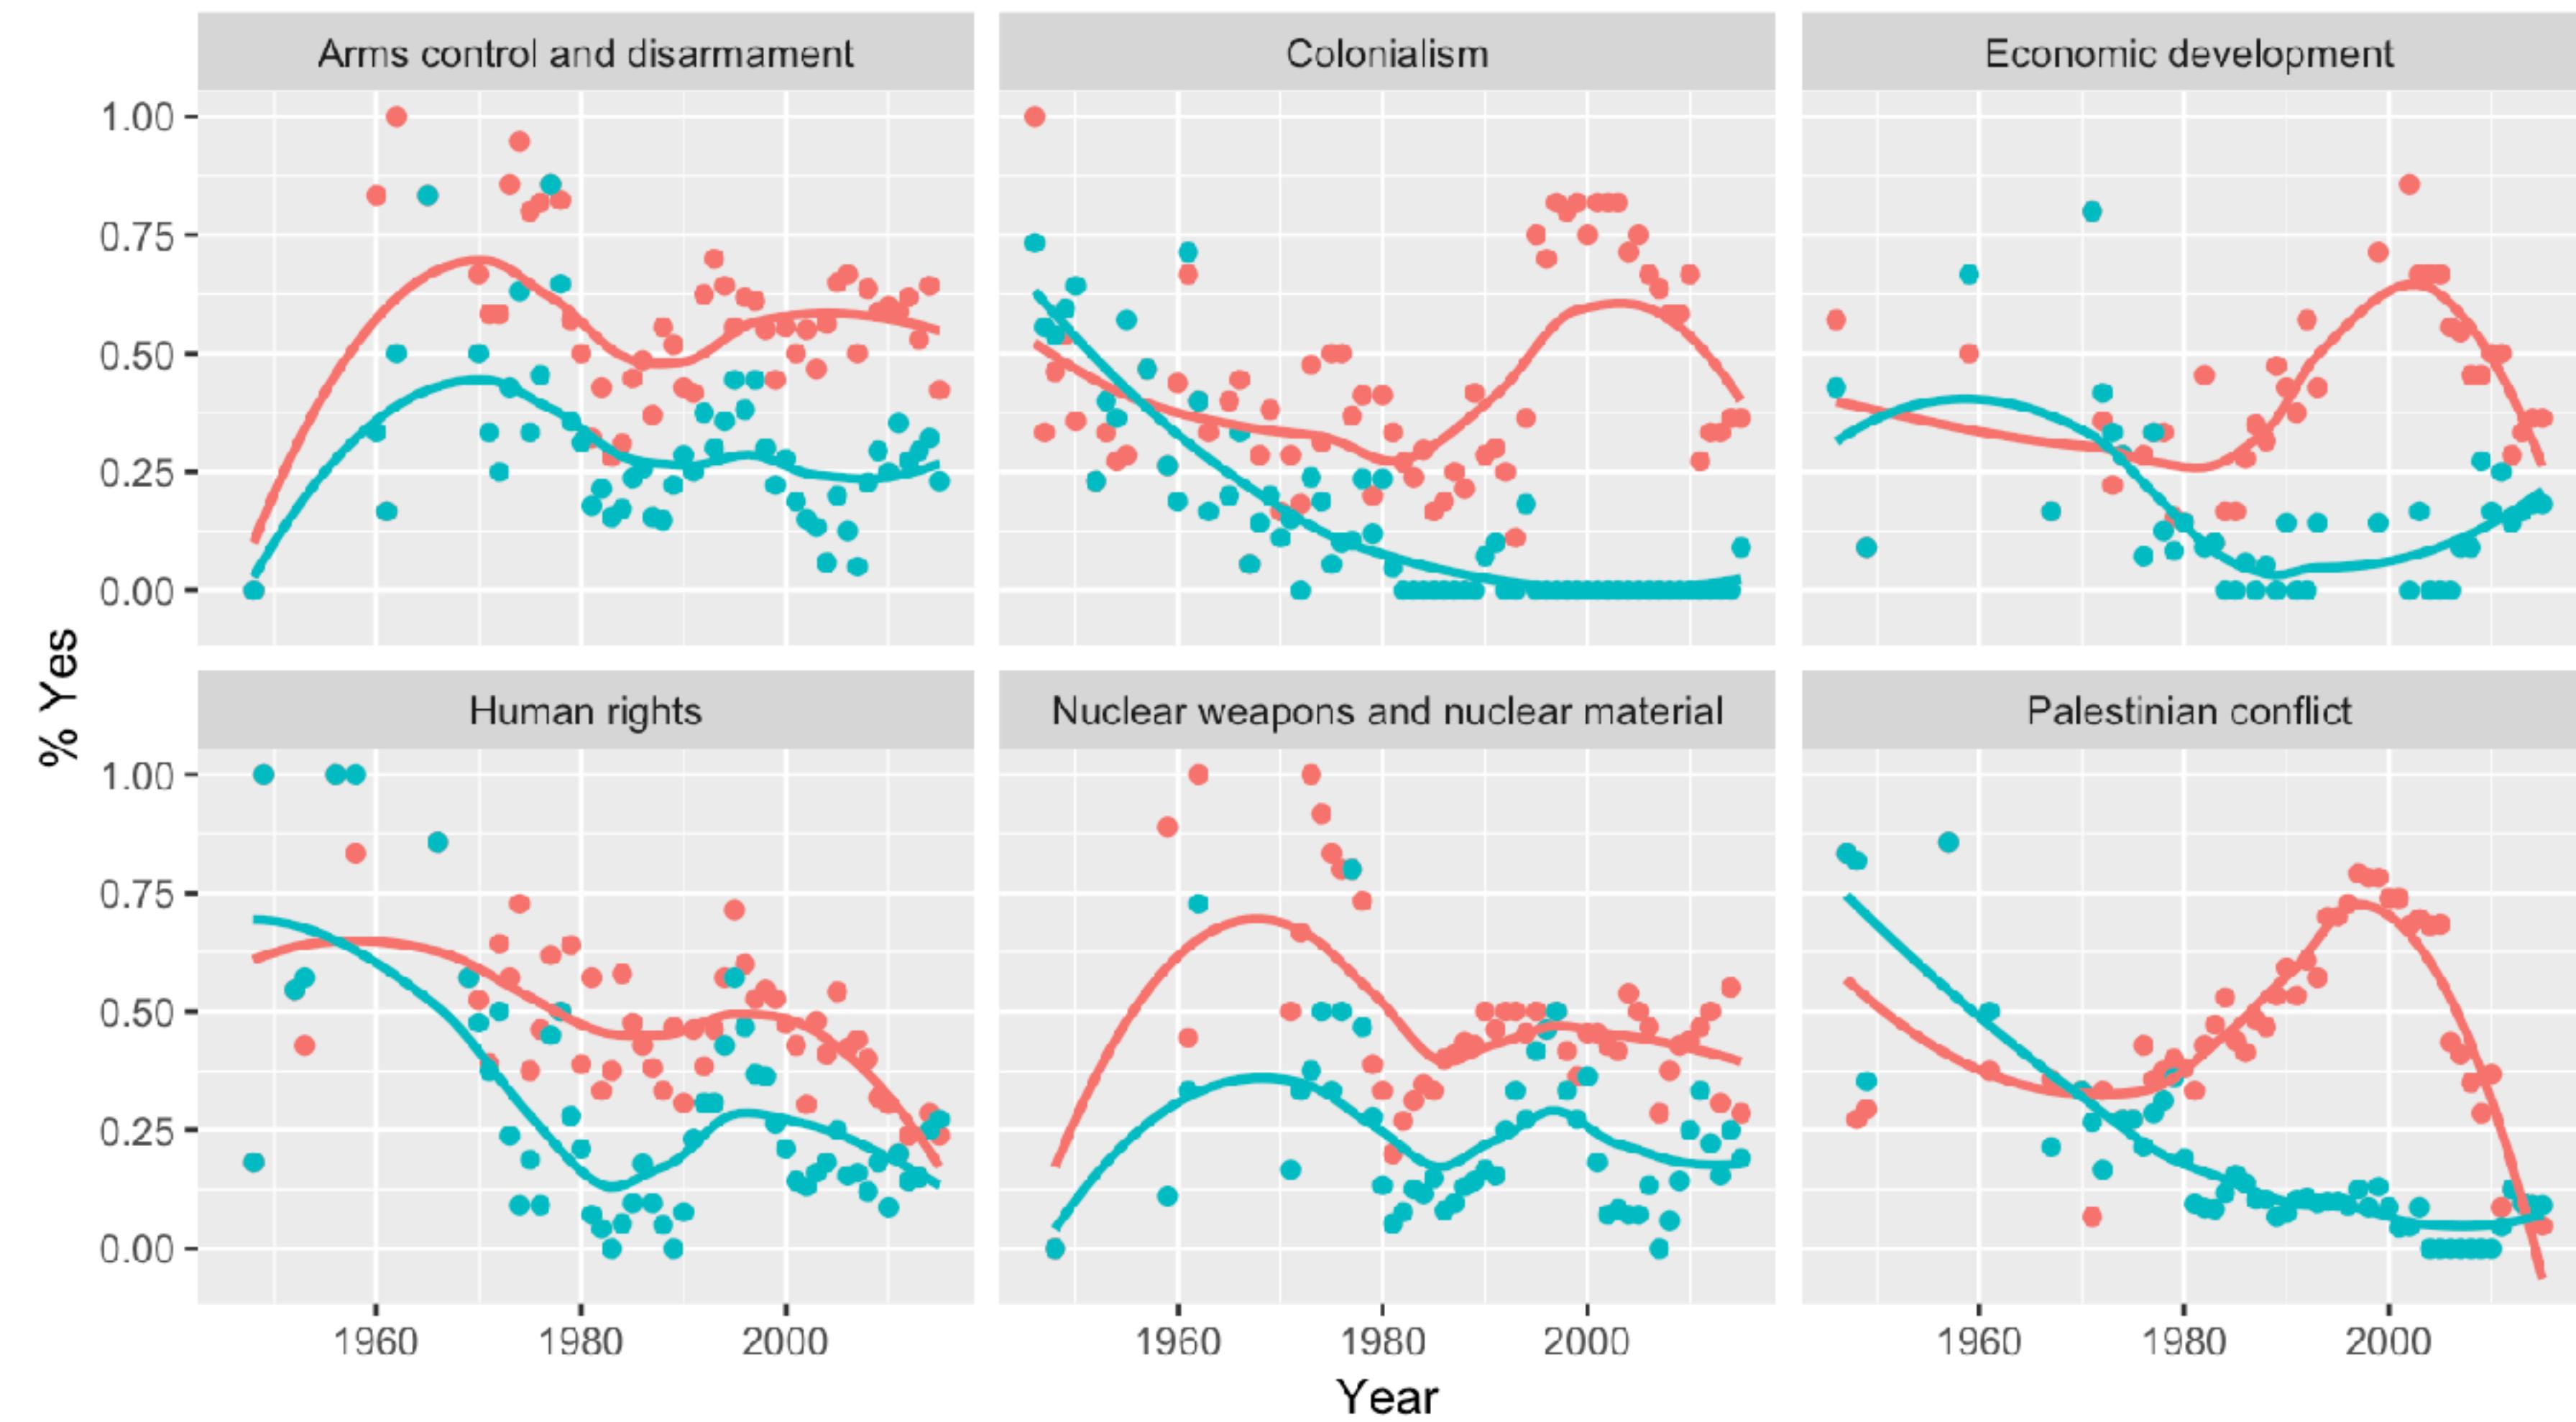

```
un_votes %>%  
  filter(country %in% c("United States of America", "Turkey")) %>%  
  inner_join(un_roll_calls, by = "rcid") %>%  
  inner_join(un_roll_call_issues, by = "rcid") %>%  
  group_by(country, year = year(date), issue) %>%  
  summarize(  
    votes = n(),  
    percent_yes = mean(vote == "yes")  
  ) %>%  
  filter(votes > 5) %>% # only use records where there are more than 5 votes  
  ggplot(mapping = aes(x = year, y = percent_yes, color = country)) +  
    geom_point() +  
    geom_smooth(method = "loess", se = FALSE) +  
    facet_wrap(~ issue) +  
    labs(  
      title = "Percentage of 'Yes' votes in the UN General Assembly",  
      subtitle = "1946 to 2015",  
      y = "% Yes",  
      x = "Year",  
      color = "Country"  
    )
```

```
un_votes %>%  
filter(country %in% c("United States of America", "Turkey")) %>%  
inner_join(un_roll_calls, by = "rcid") %>%  
inner_join(un_roll_call_issues, by = "rcid") %>%  
group_by(country, year = year(date), issue) %>%  
summarize(  
  votes = n(),  
  percent_yes = mean(vote == "yes")  
) %>%  
filter(votes > 5) %>% # only use records where there are more than 5 votes  
ggplot(mapping = aes(x = year, y = percent_yes, color = country)) +  
  geom_point() +  
  geom_smooth(method = "loess", se = FALSE) +  
  facet_wrap(~ issue) +  
  labs(  
    title = "Percentage of 'Yes' votes in the UN General Assembly",  
    subtitle = "1946 to 2015",  
    y = "% Yes",  
    x = "Year",  
    color = "Country"  
)
```

```
un_votes %>%  
filter(country %in% c("United States of America", "Canada")) %>%  
inner_join(un_roll_calls, by = "rcid") %>%

ex: Introduction to R for Data Science

Microsoft Professional Program Certificate in Data Science

Course Syllabus

Section 1: Introduction to Basics

Take your first steps with R. Discover the basic data types in R and assign your first variable.

Section 2: Vectors

Analyze gambling behaviour using vectors. Create, name and select elements from vectors.

Section 3: Matrices

Learn how to work with matrices in R. Do basic computations with them and demonstrate your knowledge by analyzing the Star Wars box office figures.

Section 4: Factors

R stores categorical data in factors. Learn how to create, subset and compare categorical data.

Section 5: Data Frames

When working R, you'll probably deal with Data Frames all the time. Therefore, you need to know how to create one, select the most interesting parts of it, and order them.

Section 6: Lists

Lists allow you to store components of different types. Section 6 will show you how to deal with lists.

Section 7: Basic Graphics

Discover R's packages to do graphics and create your own data visualizations.

COURSE

Getting and Cleaning Data

★★★★★ 4.6 5,178 ratings • 829 reviews

Before you can work with data you have to get some. This course will cover the basic ways that data can be obtained. The course will cover obtaining data from the web, from APIs, from databases and from colleagues in various formats. It will also cover the basics of data ... [MORE](#)

4
COURSE

Exploratory Data Analysis

★★★★★ 4.7 3,957 ratings • 591 reviews

This course covers the essential exploratory techniques for summarizing data. These techniques are typically applied before formal modeling commences and can help inform the development of more complex statistical models. Exploratory techniques are also important for eliminating or sharpening potential hypotheses about the world that can be addressed by the data. We will cover in detail the plotting systems in R as well as some of the basic principles of constructing data graphics. We will also cover some of the common multivariate statistical techniques used to visualize high-dimensional data. [LESS](#)

UN Votes

Mine Çetinkaya-Rundel

2018-09-26

Let's take a look at the voting history of countries in the United Nations General Assembly. We will be using data from the `unvotes` package. Additionally, we will make use of the `tidyverse` and `lubridate` packages for the analysis, and the `DT` package for interactive display of tabular output.

Data

The `unvotes` package provides three datasets we can work with: `un_roll_calls`, `un_roll_call_issues`, and `un_votes`. Each of these datasets contains a variable called `roid`, the roll call id, which can be used as a unique identifier to join them with each other.

- The `un_votes` dataset provides information on the voting history of the United Nations General Assembly. It contains one row for each country-vote pair.

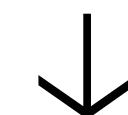

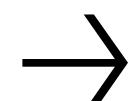

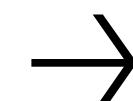

```
un_votes
```

```
## # A tibble: 738,764 x 4
##   roid country      country_code vote
##   <int> <chr>        <chr>     <fct>
## 1 3 United States of America US      yes
## 2 3 Canada          CA      no
## 3 3 Cuba            CU      yes
## 4 3 Haiti           HT      yes
## 5 3 Dominican Republic DO      yes
## 6 3 Mexico          MX      yes
## 7 3 Guatemala       GT      yes
## 8 3 Honduras        HN      yes
## 9 3 El Salvador      SV      yes
## 10 3 Nicaragua        NI     yes
## # ... with 738,754 more rows
```

- The `un_roll_calls` dataset contains information on each roll call vote of the United Nations General Assembly.

```

- Interpret the slope of the beauty score for each. What changed?

twiday

- 1 start with cake
- 2 skip baby steps
- 3 cherish day one
- 4 hide the veggies
- 5 focus on exposure

Fine,
I'm intrigued,
but I need to see
the big picture

GAISE 2016

1. Teach statistical thinking.

a. Teach statistics as an investigative process of problem-solving and decision-making.

Students should not leave their introductory statistics course with the mistaken impression that statistics consists of an unrelated collection of formulas and methods. Rather, students should understand that statistics is a problem-solving and decision-making *process* that is fundamental to scientific inquiry and essential for making sound decisions.

b. Give students experience with multivariable thinking.

We live in a complex world in which the answer to a question often depends on many factors. Students will encounter such situations within their own fields of study and everyday lives. We must prepare our students to answer challenging questions that require them to investigate and explore relationships among many variables. Doing so will help them to appreciate the value of statistical thinking and methods.

2. Focus on conceptual understanding.

3. Integrate real data with a context and a purpose.

4. Foster active learning.

5. Use technology to explore concepts and analyze data.

6. Use assessments to improve and evaluate student learning.

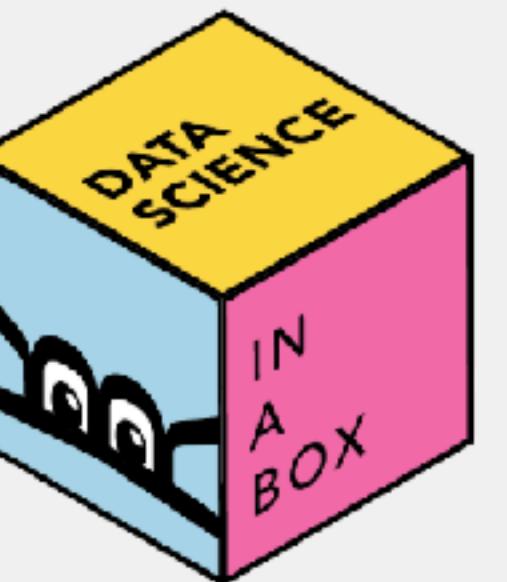

GAISE 2016, http://www.amstat.org/asa/files/pdfs/GAISE/GaiseCollege_Full.pdf.

① NOT a commonly used subset of tests and intervals and produce them with hand calculations

② Multivariate analysis requires the use of computing

③ NOT use technology that is only applicable in the intro course or that doesn't follow good science principles

④ Data analysis isn't just inference and modeling, it's also data importing, cleaning, preparation, exploration, and visualization

The course content is organized in three units:

Unit 1 - Exploring data: This unit focuses on data visualization and data wrangling. Specifically we cover fundamentals of data and data visualization, confounding variables, and Simpson's paradox as well as the concept of tidy data, data import, data cleaning, and data curation. We end the unit with web scraping and introduce the idea of iteration in preparation for the next unit. Also in this unit students are introduced to the toolkit: R, RStudio, R Markdown, Git, GitHub, etc.

Unit 2 - Making rigorous conclusions: In this part we introduce modeling and statistical inference for making data based conclusions. We discuss building, interpreting, and selecting models, visualizing interaction effects, and prediction and model validity. Statistical inference is introduced from a simulation based perspective, and the Central Limit Theorem is discussed very briefly to lay the foundation for future coursework in statistics.

Unit 3 - Looking forward: In the last unit we present a series of modules such as interactive reporting and visualization with Shiny, text analysis, and Bayesian inference. These are independent modules that instructors can choose to include in their introductory data science curriculum depending on how much time they have left in the semester.

Let them eat cake (first)!*
